

WHM Automation Script Execution Guide

Instructions for Running the Script:

Step 1: Configure the Hostname -

- First, set or update the hostname on the **Direct-Admin server**.
- Next, log in to the **DNS host server** and create the required DNS record for the hostname. Use the following naming convention:

`<client-name><last-IP-digit>.dnshostserver.in`

Example : [Pinnacle80.dnshostserver.in](#).

Step 2: Apply the License -

- Apply the license to the server IP using **GetLic** or **V2**, depending on your licensing source.
- **Note:** If an original license is required for the server, do not use **GetLic** or **V2**. Skip this step and apply the original license.

Step 3: Download and Execute the WHM Automation Script -

- Log in to the server where **WHM** will be installed.
- Download the automation script from GitHub:
- Using wget:

<https://raw.githubusercontent.com/kushal-hostnetindia/WHM-Automation-script/main/auto.sh>

- Make the script executable : `chmod +x auto.sh`
- Run the script:: `./auto.sh`

Step 4: Configure the WHM Automation Script -

Once the script starts, carefully read the on-screen instructions. Press **Enter** to continue.

Provide the required details when prompted:

- **Your Name** – Enter your name.
- **Client Name** – Enter the client's name
- **Hostname** – The hostname **must exactly match** the DNS record created in **Step 1** using the following format:
`<client-name><last-IP-digit>.dnshostserver.in`
Example: `Pinnacle80.dnshostserver.in`
- **cPanel Version** – Enter the required cPanel version (e.g., `11.126`, `11.130`, `11.132`, `11.134`, `11.136`, or `release`). Press **Enter** to install the latest available version.
- **License Source** – Select the appropriate option:
 - ❖ **1** – V2 License
 - ❖ **2** – GetLic
 - ❖ **3** – Skip license installation
- **Node Exporter** – Choose whether to install Node Exporter by entering **Yes** or **No**.
- **Congratulations!** The automation script has started successfully.
 - ❖ Please wait **2–3 minutes** until the script completes and returns to the terminal screen. Once the process is finished, you may safely exit the script.

Troubleshooting -

- **Note:** If the script **fails** because the `screen` package cannot be installed or you encounter a **DNS resolution error**, update the DNS resolver by running the following commands:
 - ❖ `cat >> /etc/resolv.conf <<EOF`
 - ❖ `nameserver 8.8.8.8`
 - ❖ `nameserver 8.8.4.4`
 - ❖ `EOF`
- This issue usually occurs due to incorrect DNS configuration on the server. After updating the DNS settings, rerun the automation script.
